Course	BSHC in Computing
Supervisor	Athanasios Staikopoulos

Month: September

What?

Reflect on what has happened in your project this month?

This month, I delivered my midpoint presentation and reached a stable, fully working state for both the Map My House and My Appliances features. These sections are now fully operational, allowing users to create rooms, assign appliances, and manage their household layout through the application. I also spent time reviewing feedback from the midpoint presentation and reflecting on how the project could be improved.

Based on this feedback, I began rethinking parts of the Watch Your Watts feature. Rather than implementing it immediately, I used December to explore new ideas around how energy usage could be visualised more clearly and how predictions could be made more meaningful for users. This included considering different chart types, clearer comparisons and more practical insights for reducing electricity usage.

So What?

Consider what that meant for your project progress. What were your successes? What challenges remain?

Completing the midpoint presentation was an important checkpoint because it confirmed that the core structure of the project is working as intended. Having Map My House and My Appliances fully functional means the foundation of the system is now in place, and the app can correctly collect the data needed for energy analysis. Feedback from the presentation helped validate some of my design choices while also highlighting areas where the user experience and insights could be improved, particularly around data visualisation and interpretation.

Taking time to step back and reassess Watch Your Watts was valuable. Instead of rushing into implementation, I now have a clearer idea of how to make the feature more useful and user-friendly. This reduces the risk of building something that looks good but does not provide meaningful value to the user.

Now What?

What can you do to address outstanding challenges?

In the new year, I will begin implementing the revised Watch Your Watts feature using the feedback and ideas developed this month. This will involve building the backend logic for energy calculations and connecting it to the frontend through charts and summaries. I also plan to continue refining the overall user experience and improving the clarity of insights provided to users. With the core features completed and feedback incorporated, the project is well positioned to move into its final development phase.
