

Supervision & Reflection Template

Student Name	Liam Connell
Student Number	X22511759@student.ncirl.ie
Course	BSHC in Computing
Supervisor	Athanasios Staikopoulos

Month: September

What?

Reflect on what has happened in your project this month?

This month, I focused on building out two major user-facing features: **My Appliances** and **Map My House**. I connected both sections to the backend so users can create rooms, add appliances, and manage their household layout through the app. The My Appliances page now pulls data from the appliance database I created earlier, and users can assign appliances to specific rooms. Map My House also became functional, allowing users to add floors, create custom room names, and build the structure of their home inside the app.

So What?

Consider what that meant for your project progress. What were your successes? What challenges remain?

Completing My Appliances and Map My House was a key milestone because these features form the backbone of how users interact with their data. They also directly support the energy-tracking features described in the system overview. Now that users can build their home layout and assign appliances to rooms, the project is much closer to supporting energy-estimation and analytics in later sprints.

Preparing the midpoint documentation and presentation introduced new challenges. It required pulling together work from multiple parts of the system, including diagrams, architectural decisions, and sprint progress. The challenge wasn't just writing everything—it was organising it in a way that clearly shows the project's structure and progress so far. Making sure the documentation matched the technical reality of the project and the expectations of the assessment took more time than expected.

Now What?

What can you do to address outstanding challenges?

Next month, I will continue building toward the midpoint submission by finalising the documentation, diagrams, and presentation material. I also plan to move into implementing the energy calculation features, starting with basic usage estimations and endpoints that return consumption data. With the core structure (authentication, rooms, appliances) now in place, the next step is to connect user inputs to meaningful energy insights.
